

From Web Data to Visualization via Ontology Mapping

Owen Gilson

Swansea University, UK

December 2008

Outline:

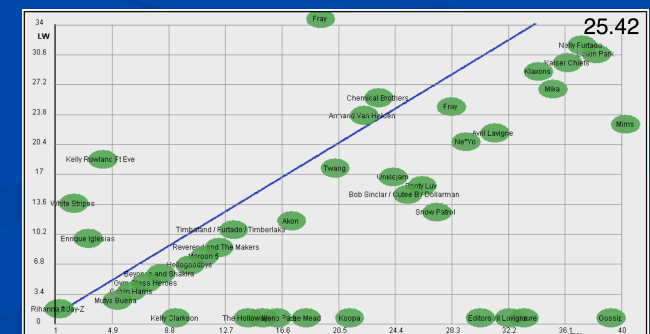

- What is Information Visualization?
- Motivation
- Related Work
- SemViz Pipeline
- Ontologies with Certainty Factors (OCF)
 - Domain Ontology (DO)
 - Visual Representation Ontology (VRO)
 - Semantic Bridge Ontology (SBO)
- Ontology Mapping Algorithm
- Results
- Summary

What is Information Visualization?

- “The use of computer-supported, interactive, visual representations of *abstract data* to amplify *cognition*”
- [Card et al., 1999]

[Card et al., 1999]

- Examples
 - Tree Map
 - Parallel Coordinates
 - 2D graph
 - Graph Network

From Tabular Web Data to TreeMap

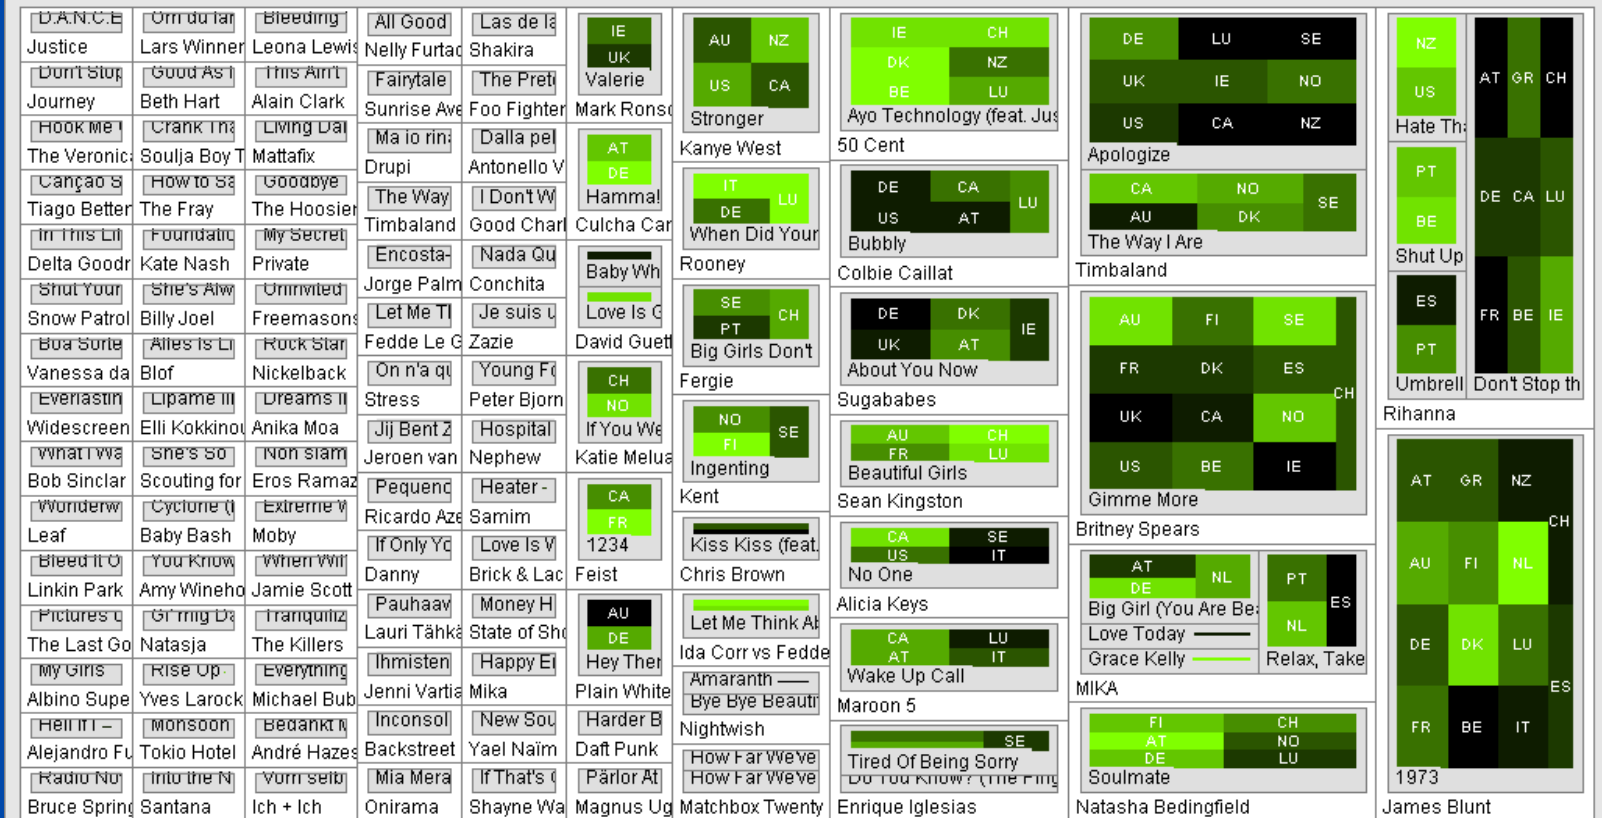

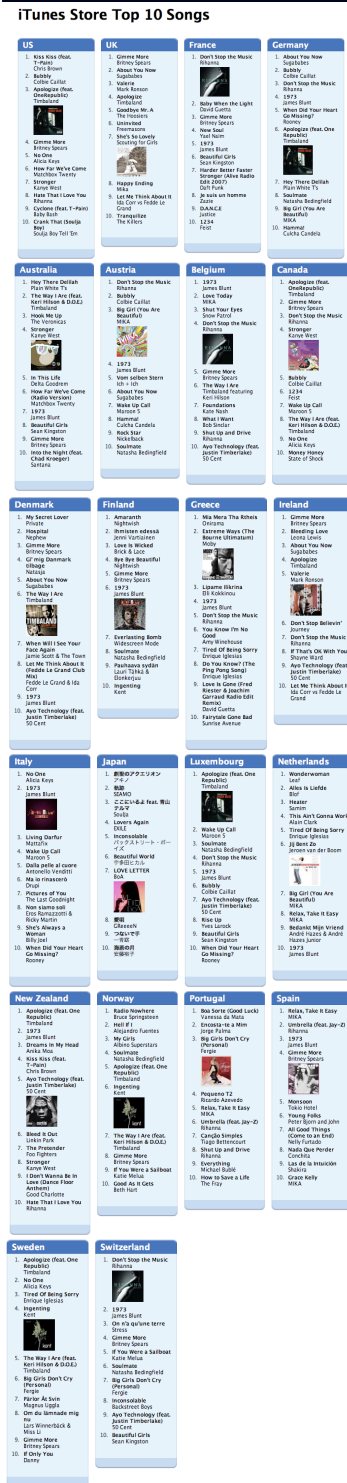

4 fields: 22 countries... \therefore 220 records...

- Country Name
- Artist Name
- Song Name
- Chart Position

ILOG

Discovery

[Baudel 2002]

Visualization As Mapping

4 fields:

- Country Name
- Artist Name
- Song Name
- Chart Position

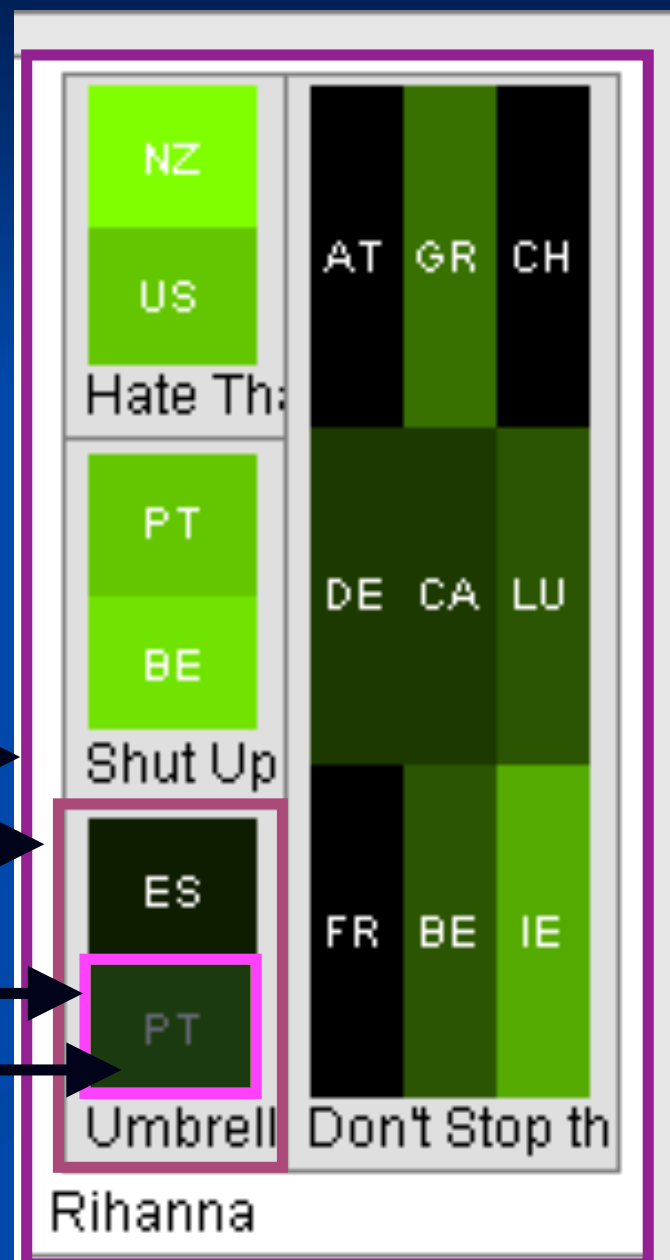

It's a Mapping Process...

Source (iTunes)

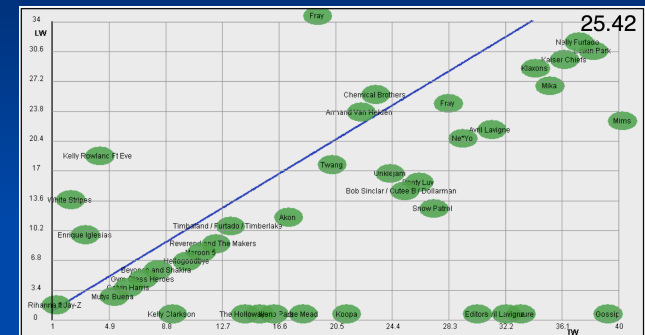

Artist Name
Song Name
Country Name
Chart Position

Target (TreeMap)

Level 0
Level 1
Level 2
Colour

- Tree Map
- Parallel Coordinates
- 2D plot
- Graph Network
- ...

“Visualization for Everyone”

[Mackinlay 2007]

Problems:

1. How do we get the Web Data?

Extract data. Use a Screen Scraper.

```
<tr>  
  <td>Artist</td>  
  <td>Song</td>  
  ...  
</tr>
```

2. What is the source data meaning?

Capture *Domain Semantics*. Use an Ontology.

3. What can a visualization style convey?

Capture *Visual Representation Semantics*. Use an Ontology.

4. How do you present “source data meaning” using “visualization meaning”?

Map between *Source Data Entities* and *Target Artefacts*.
Use Ontology Mapping.

Domain Ontology (DO) : Music

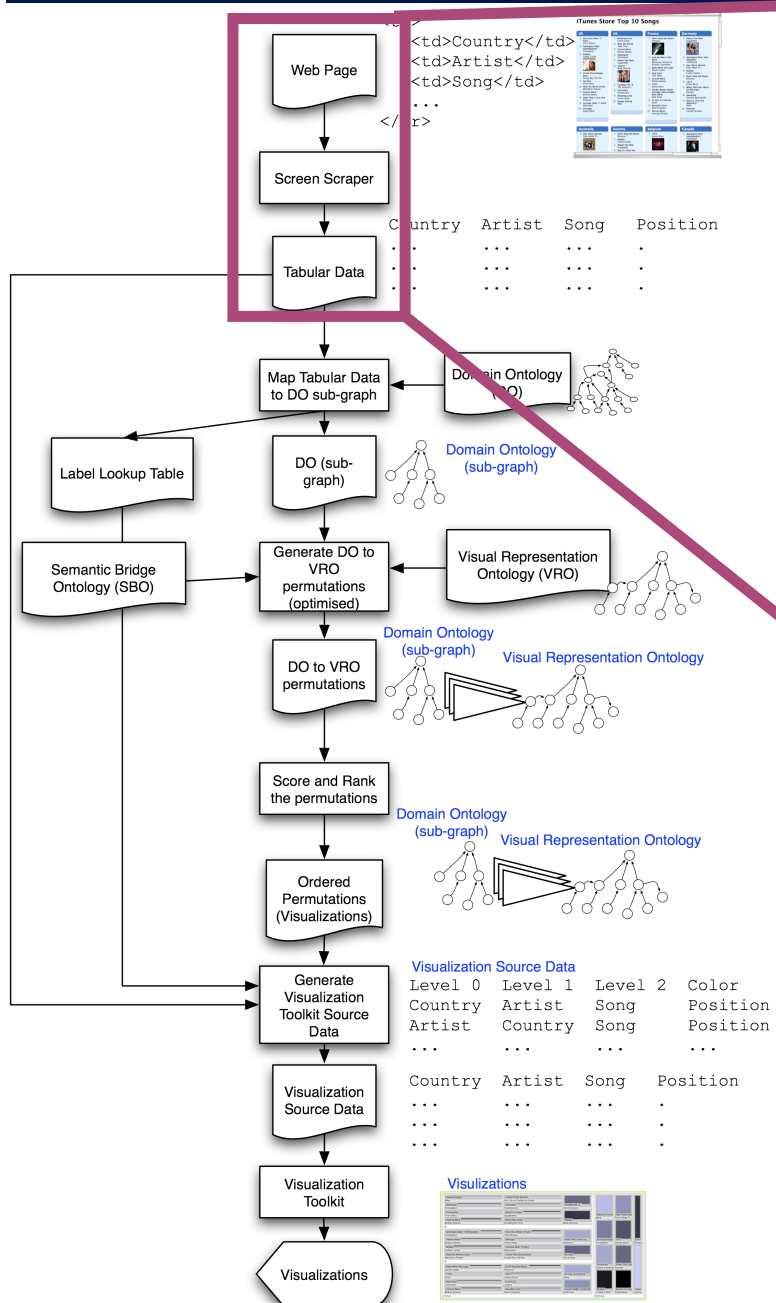

Concept

Weighted
Relation
(0 → 1)

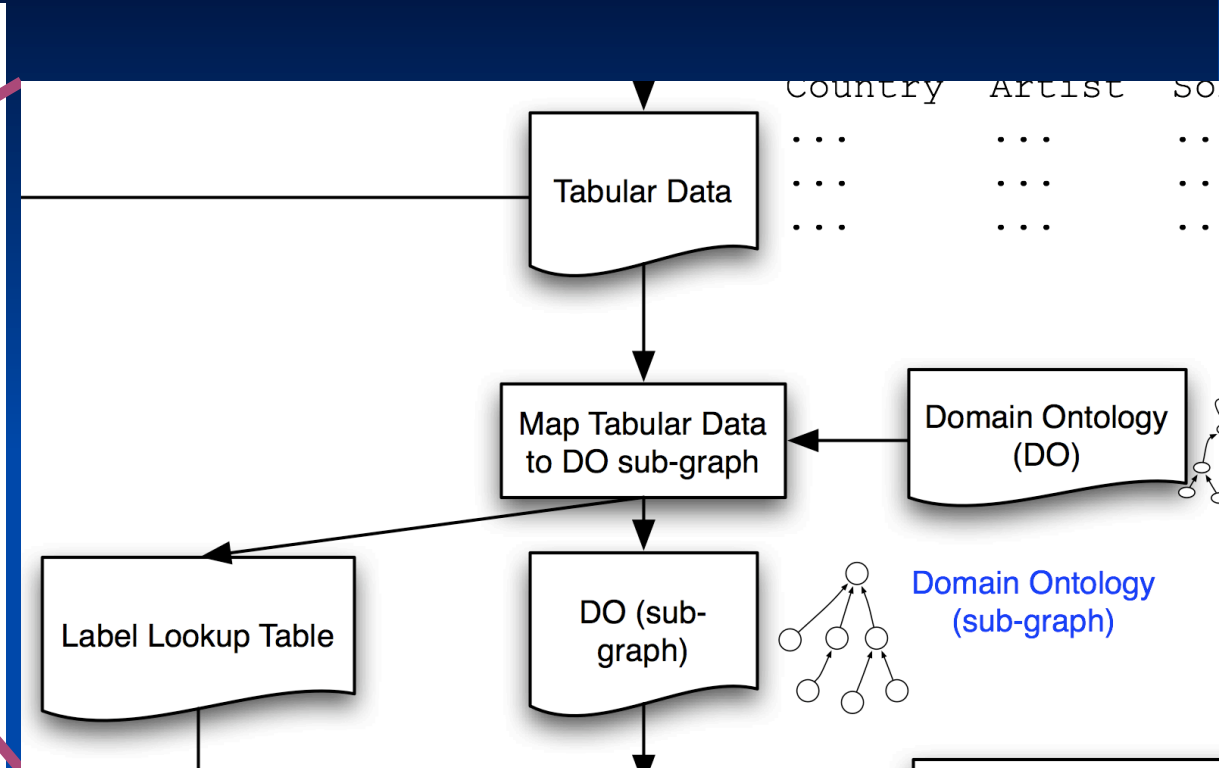

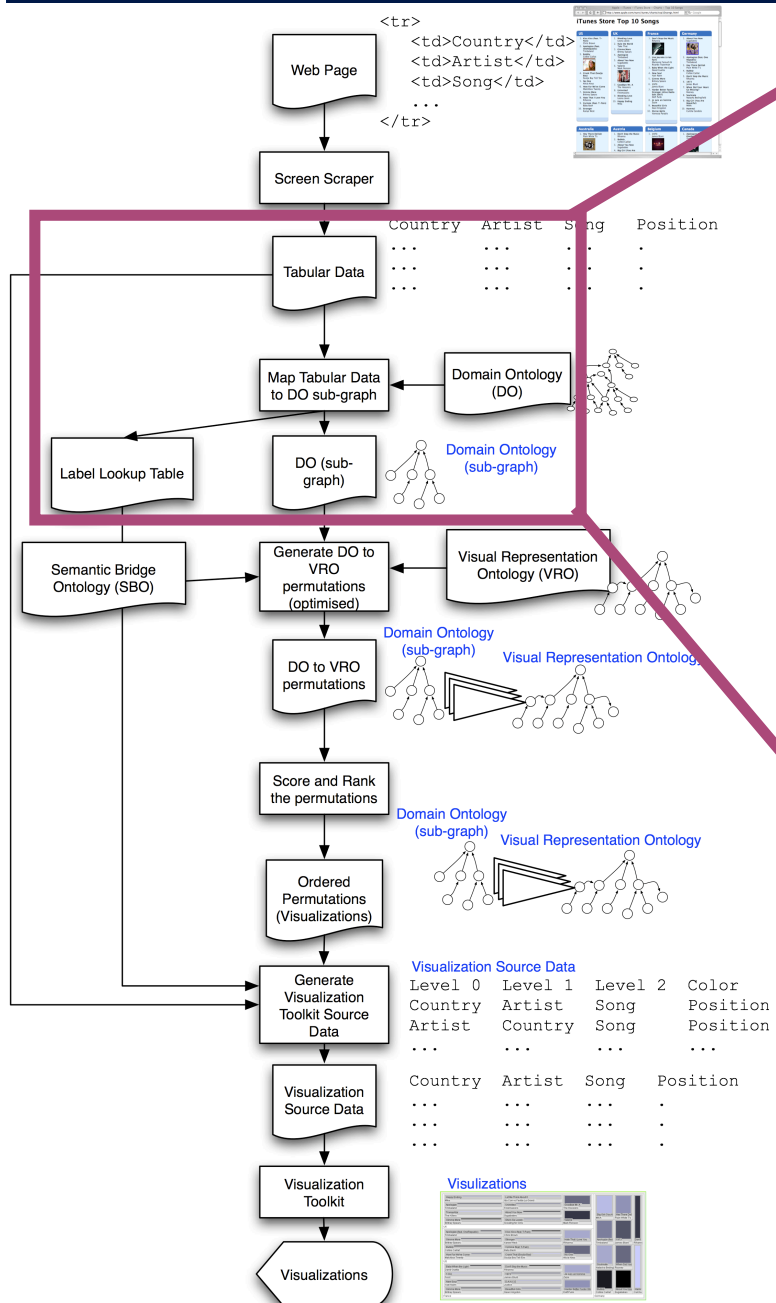

Attribute

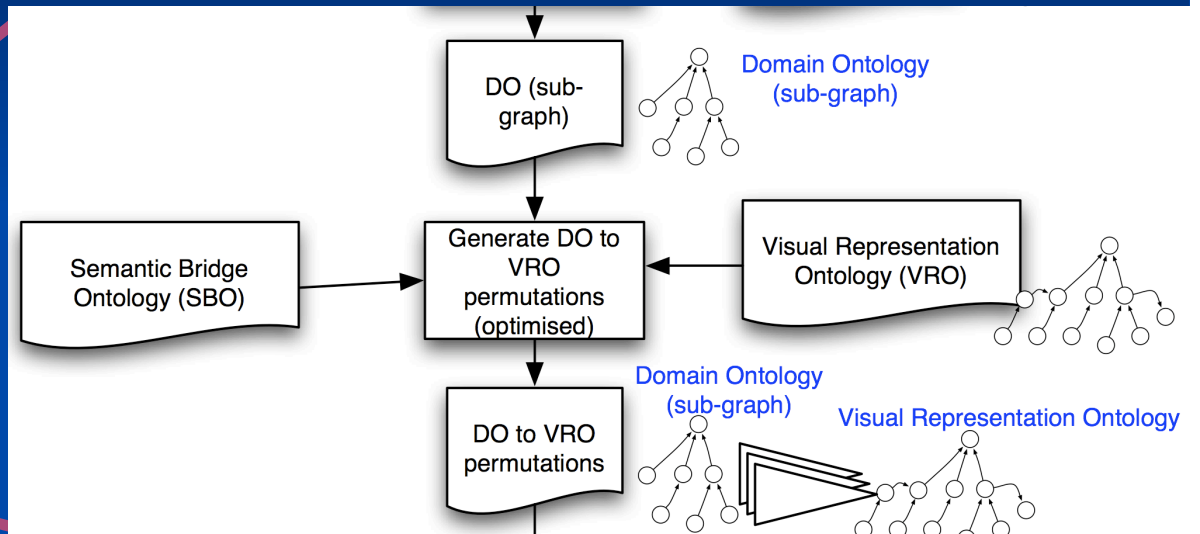

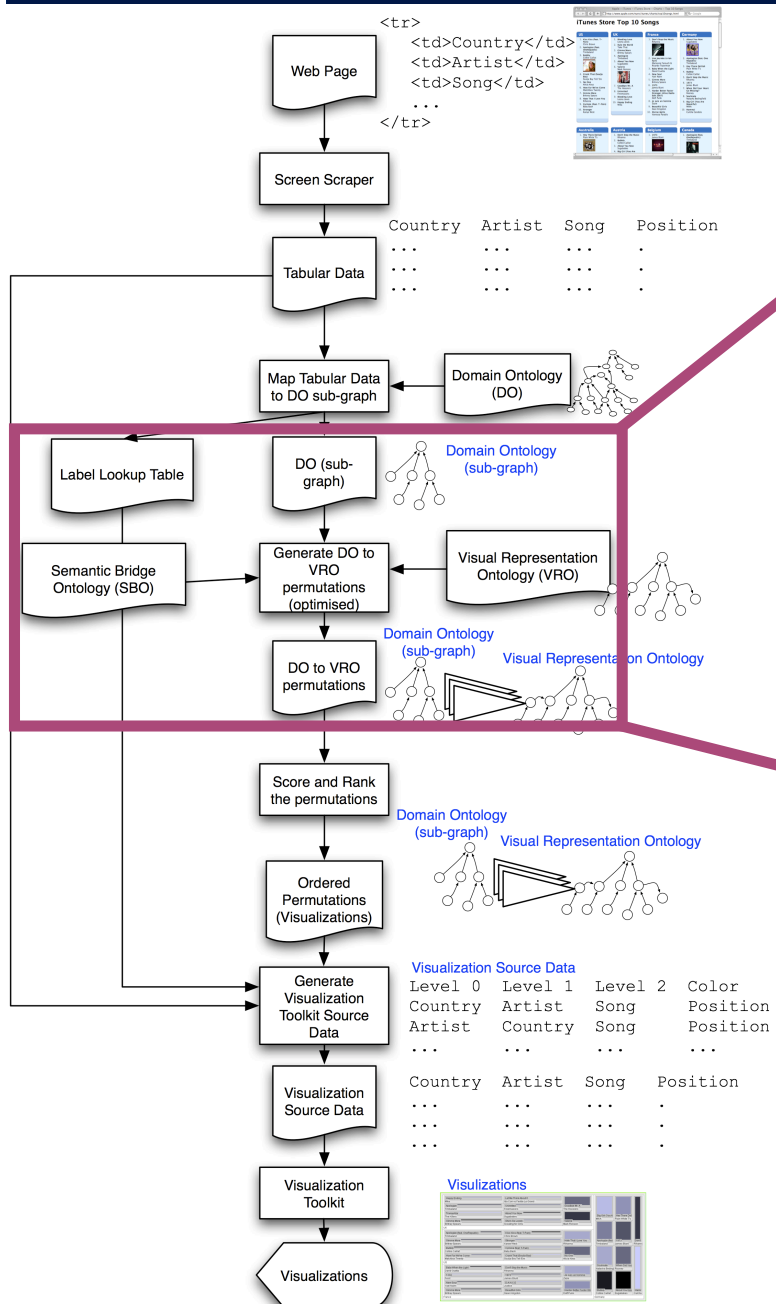

SemViz Pipeline (Web Page to Tabular Data)

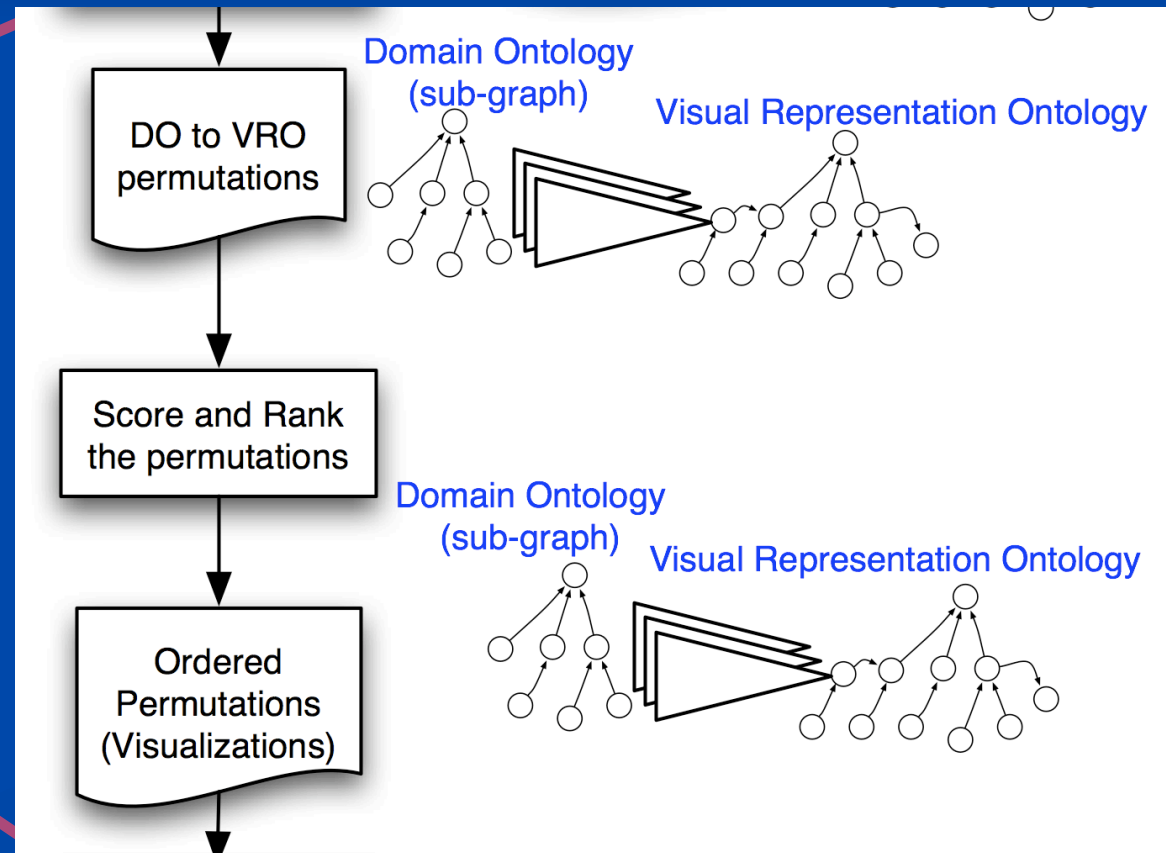

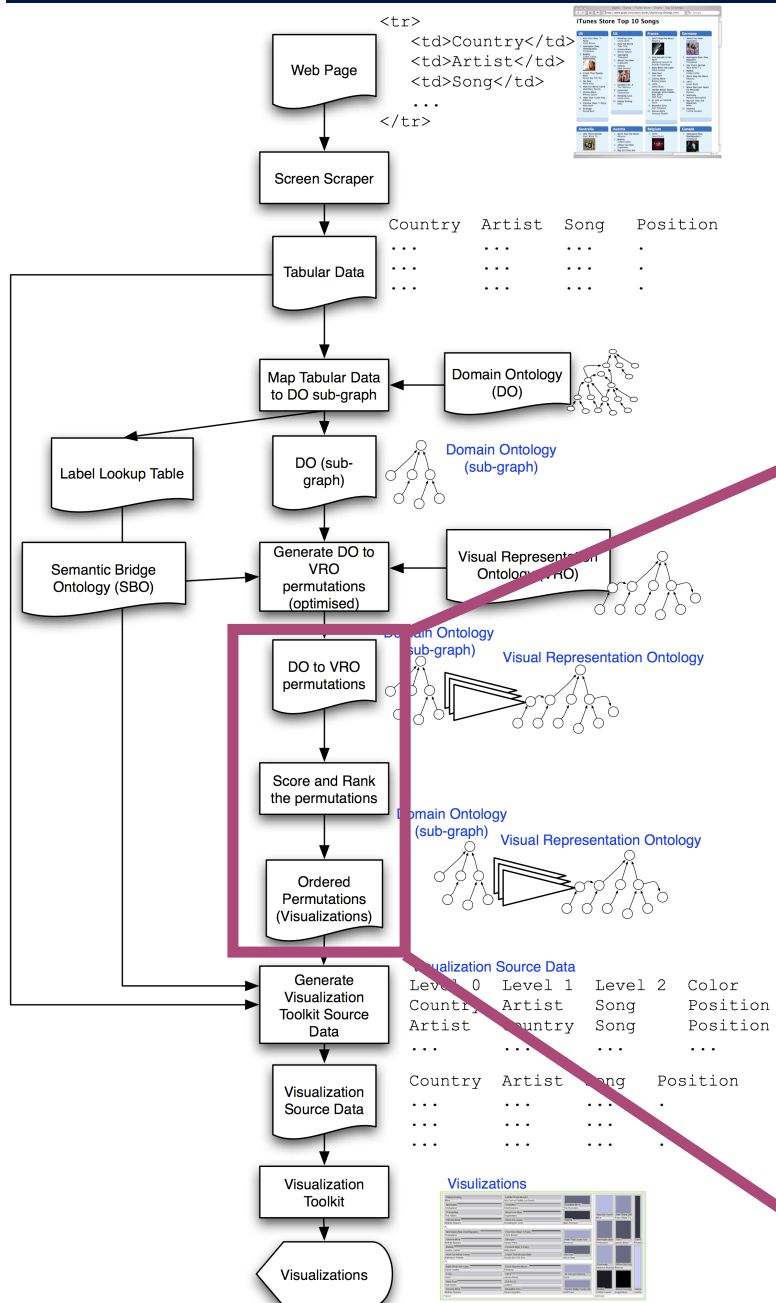

SemViz Pipeline (Tabular Data to DO sub-graph)

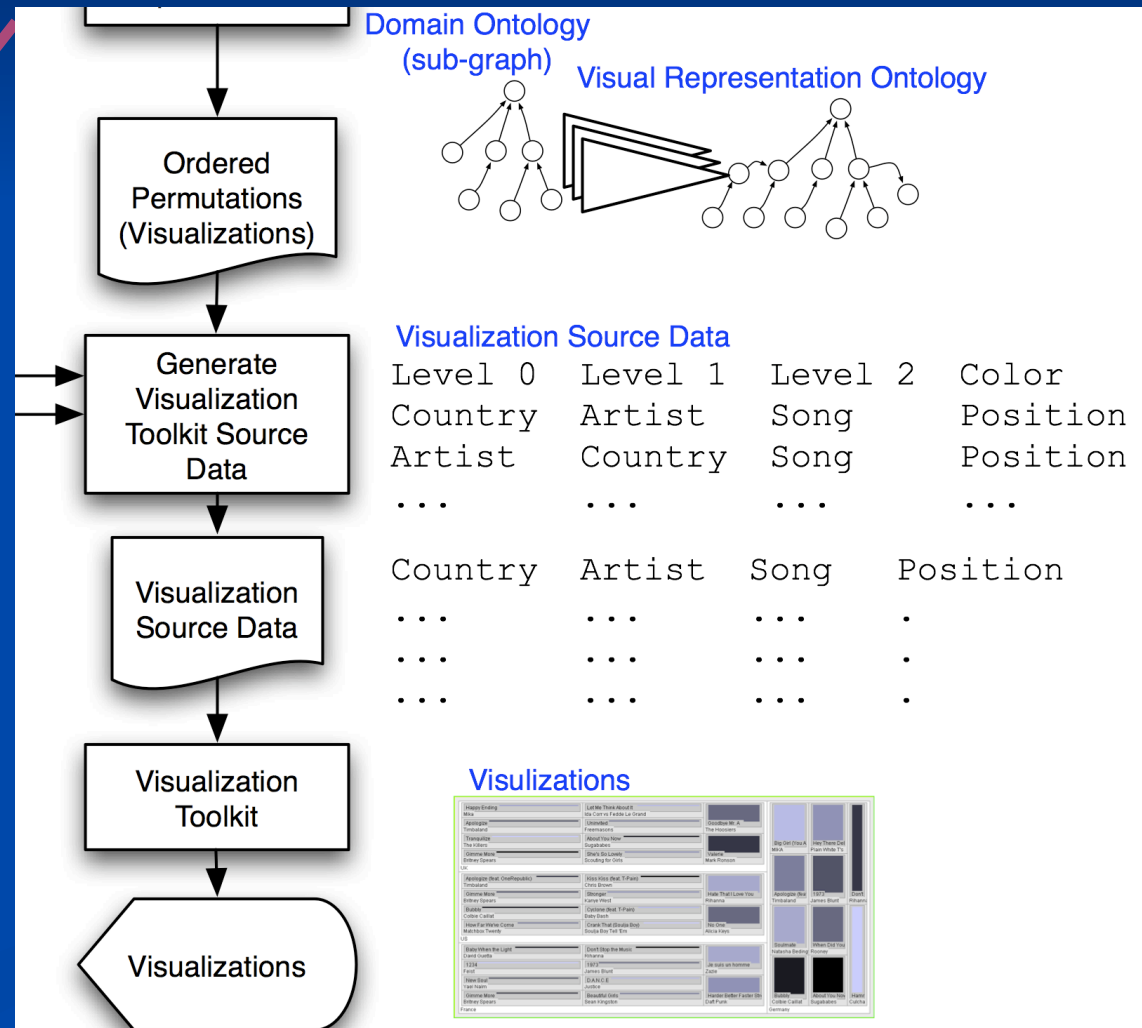

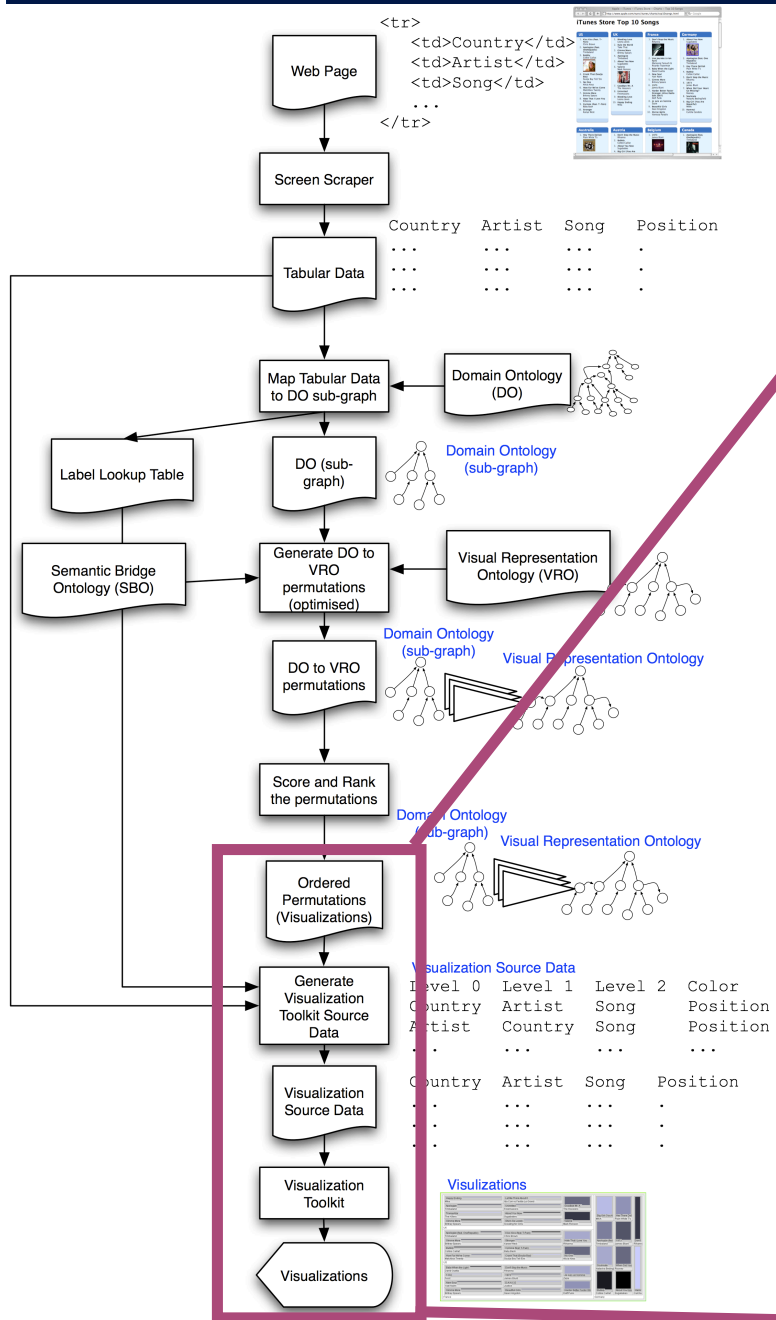

SemViz Pipeline (DO sub-graph to VRO)

SemViz Pipeline (Score DO to VRO)

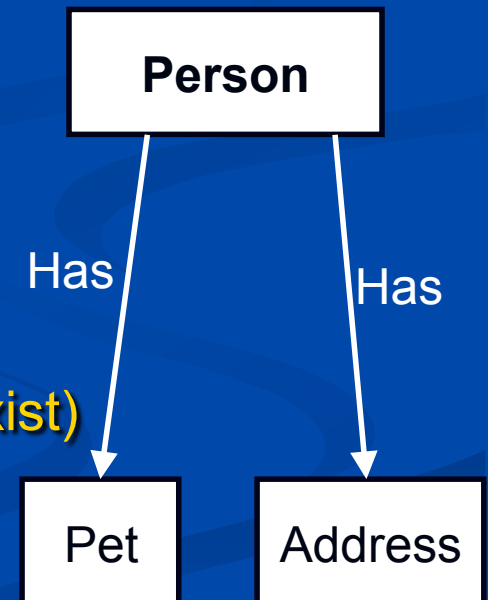

SemViz Pipeline (Generate Visualizations)

“Traditional” Ontologies

- Graph Representation of Domain Knowledge
- Syntactically and Semantically rich
- Hierarchy of concepts and properties
- (e.g. Music Ontology Specification (MOS))

- Absolute relations (it exists, or does not exist)
- RDF / OWL

Ontologies with Certainty Factors (OCF)

- (Still a) Graph Representation of Domain Knowledge
- (Can be) Syntactically and Semantically rich
- (Can have a) Hierarchy of concepts and properties

- Weighted relations (0.0 \rightarrow 1.0)

- Fully connected graph

- RDF (with weighted properties through Reification)

Traditional vs Ontologies with Certainty Factors

	Traditional (RDF/OWL)	OCF (RDF)
Explicit Conceptualisation	Yes	Can be
Syntactically and Semantically rich	Yes	Can be
Hierarchy of concepts	Yes	Can be
Hierarchy of properties	Yes	Can be
Relations	Absolute	Weighted (0.0 → 1.0)
Technology	RDF / OWL	RDF
Connectedness	Partial	Fully

Domain Ontology (DO) : Music

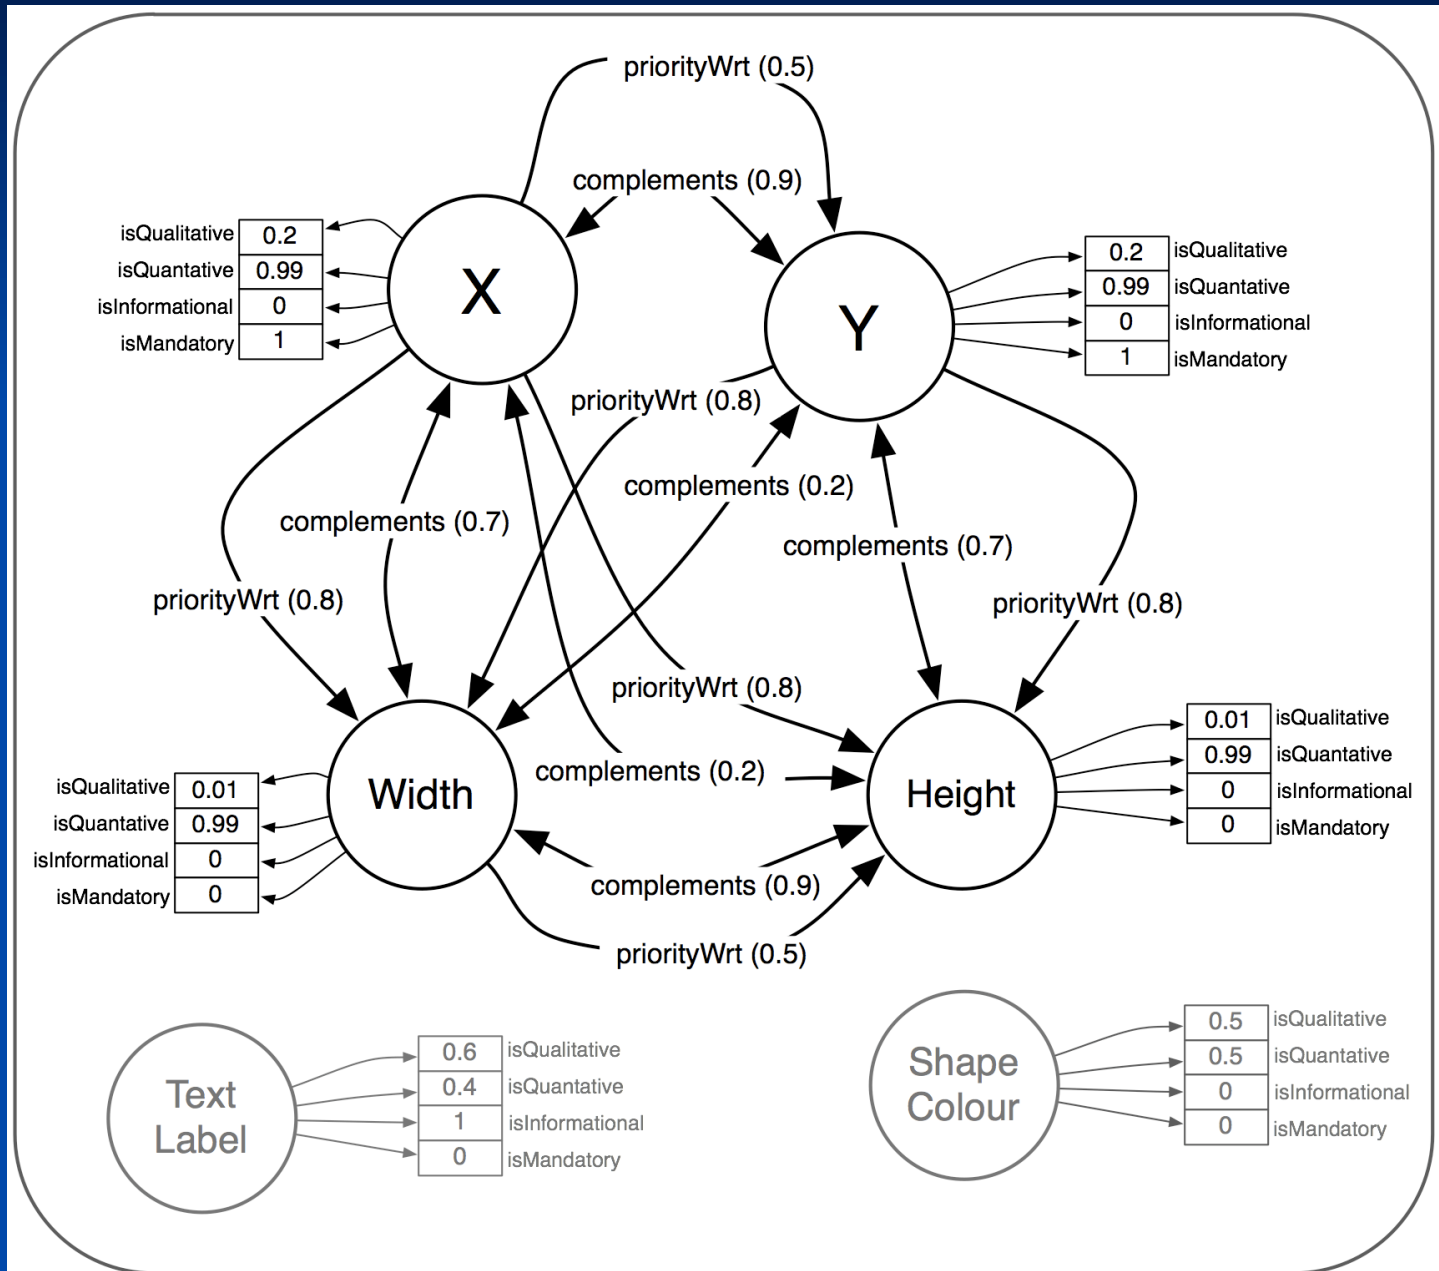

Concept

Weighted
Relation
(0 → 1)

Attribute

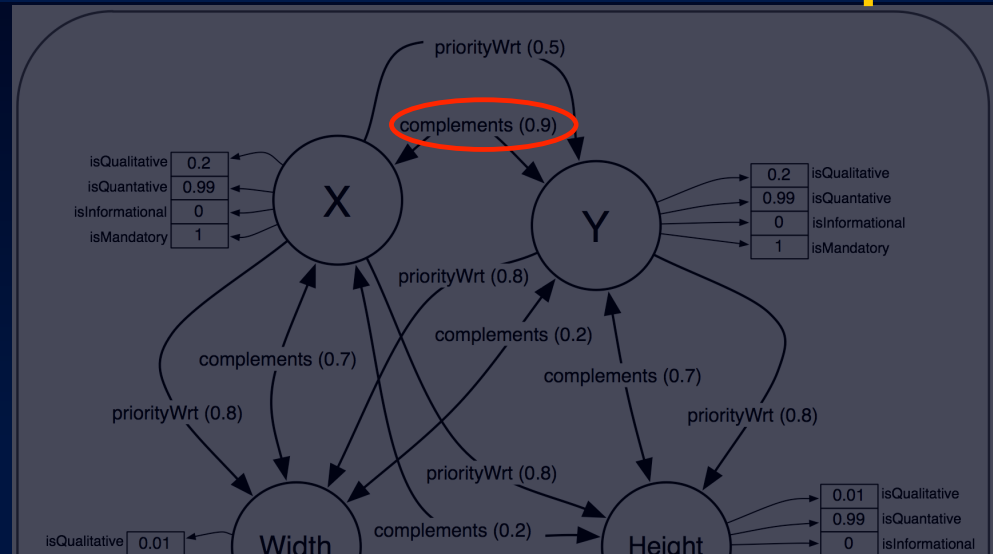

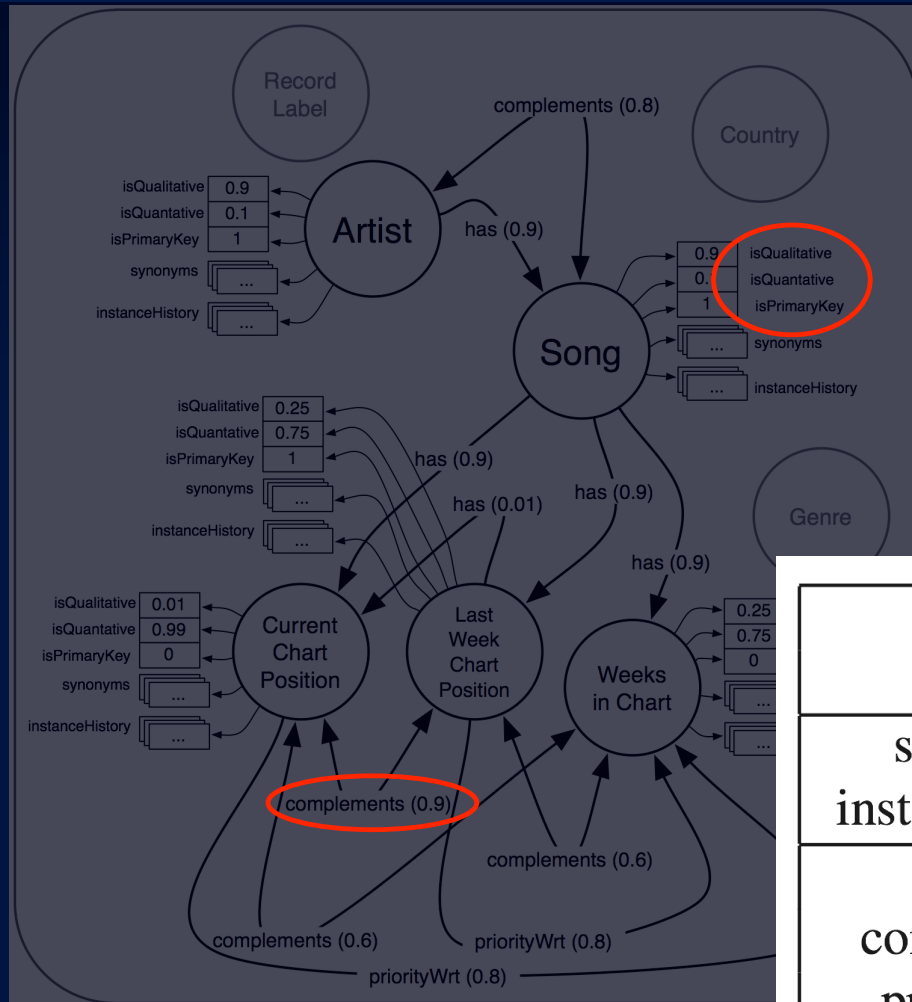

Visual Representation Ontology (VRO) : 2D plot

Semantic Equivalence

DO : Music

VRO : 2D plot

DO	VRO	Relationship / Attribute
synonyms	-	A
instanceHistory	-	A
has	contains	R
complements	complements	R
priorityWrt	priorityWrt	R
isQualitative	isQualitative	A
isQuantitative	isQuantitative	A
isPrimaryKey	isInformational	A
-	isMandatory	A

Mapping Permutations

iTunes:

- Country Name
- Artist Name
- Song Name
- Chart Position

TreeMap:

- Level 0
- Level 1
- Level 2
- Colour

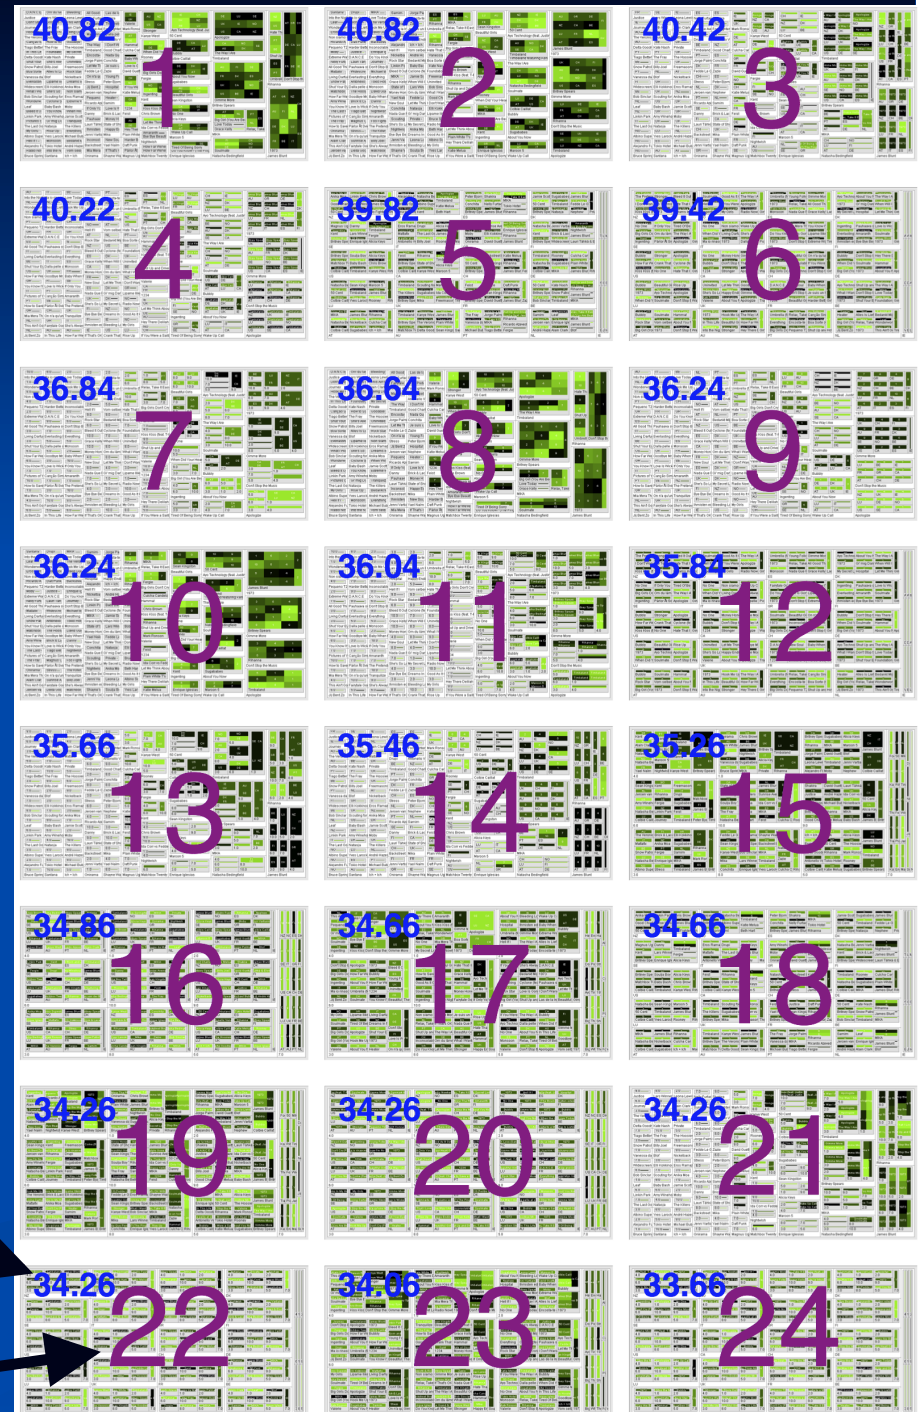

Assuming all fields are mapped
only once, there are:
24 permutations

Which visualization is best?

Calculate “Cognitive Value”

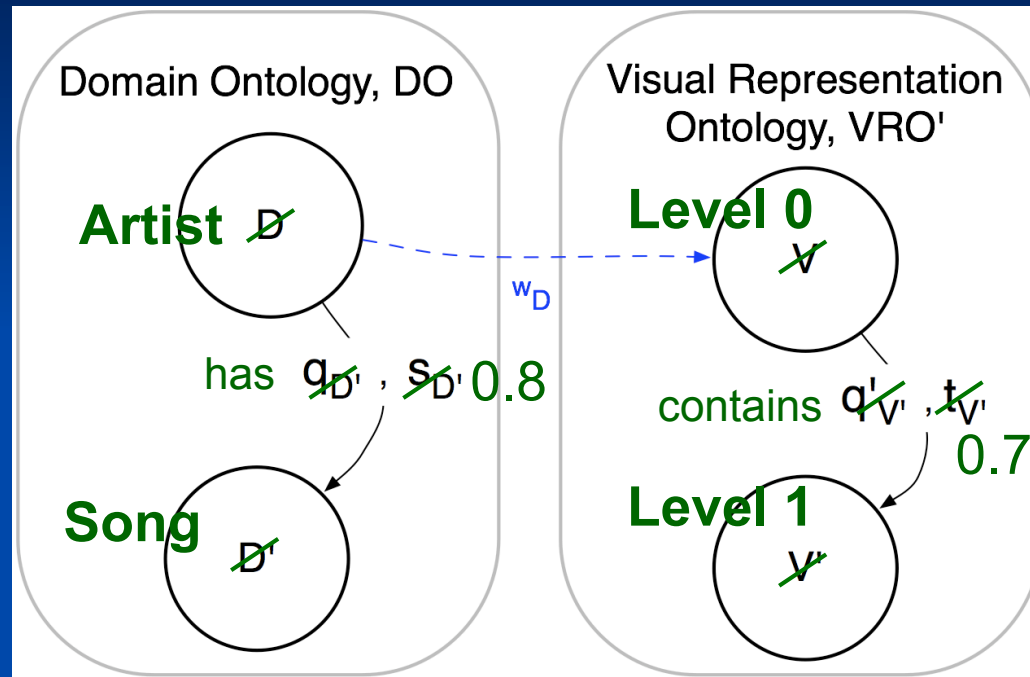

Score

Rank

Scoring Algorithm

- Based on "Ontology Mapping With Uncertainty" [Mitra et al, 2005]

Let Θ be the mapping from DO to VRO

So: $V = \Theta(D)$
 $V' = \Theta(D')$

w_D is the weighting of the concept pair DV .

If: $q_{D'} \sim q_{V'}$
 $0 \leq s_{D'} \leq 1$
 $0 \leq q_{V'} \leq 1$

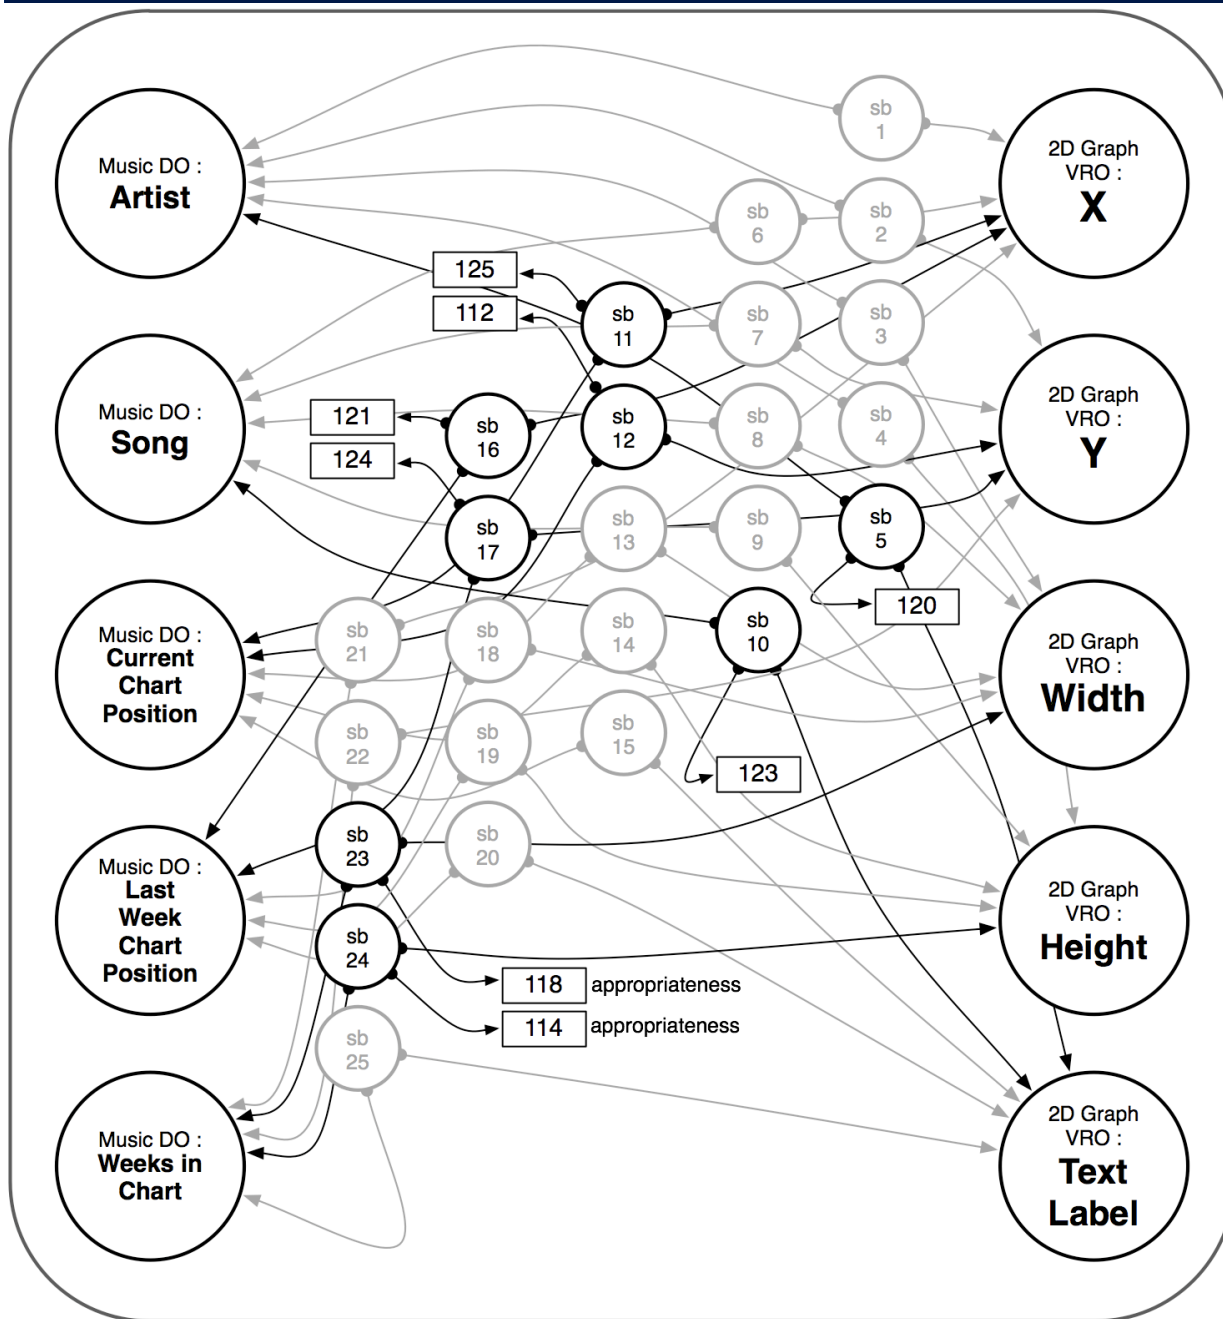

$$\begin{aligned} w_D &= 1 - |s_{D'} - t_{V'}| \\ &= 1 - |0.8 - 0.7| \\ &= 0.9 \end{aligned}$$

$$w_D = \sum_{D' \neq D} f_1(s_{D'}, t_{V'})$$

$$totalw_{\theta} = \sum_{D \in DO} w_D$$

$$f_1(s, t) := 1 - |s - t|$$

Semantic Bridge Ontology (SBO)

- Stores *available* expert knowledge
- Records all possible mappings between all DO's and all VRO's
- Fully-connected graph
- Each mapping has an *appropriateness* value
- Default is 100, increased or decreased as necessary.
- 2 purposes:
 - Reduces complexity.
 - Increases accuracy.

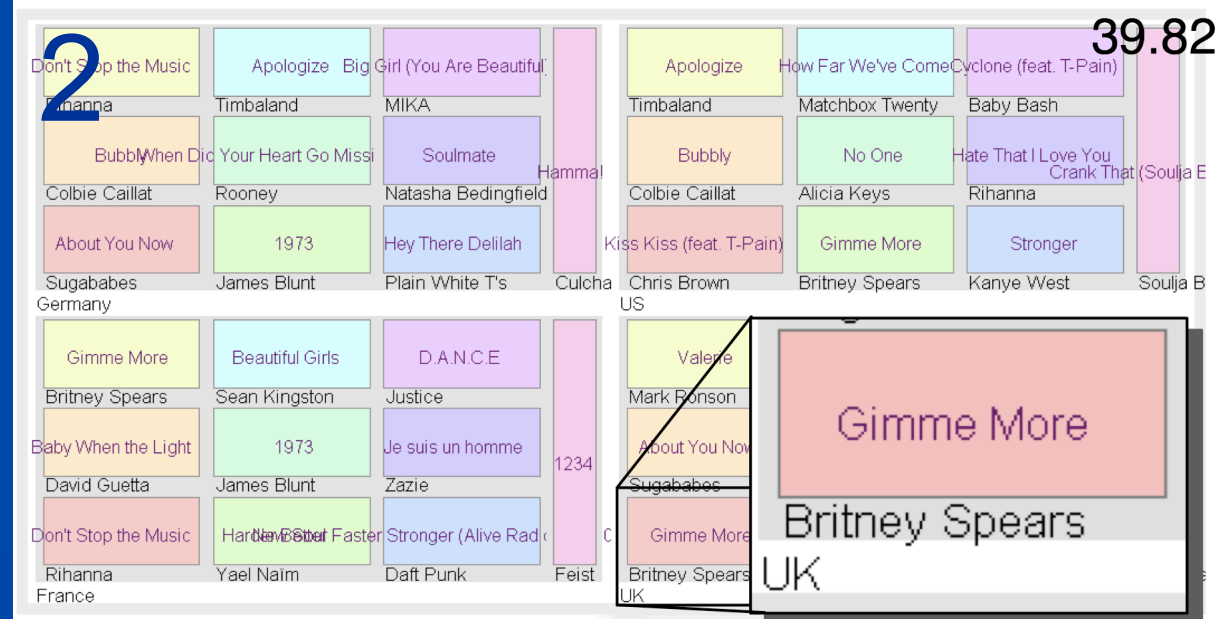

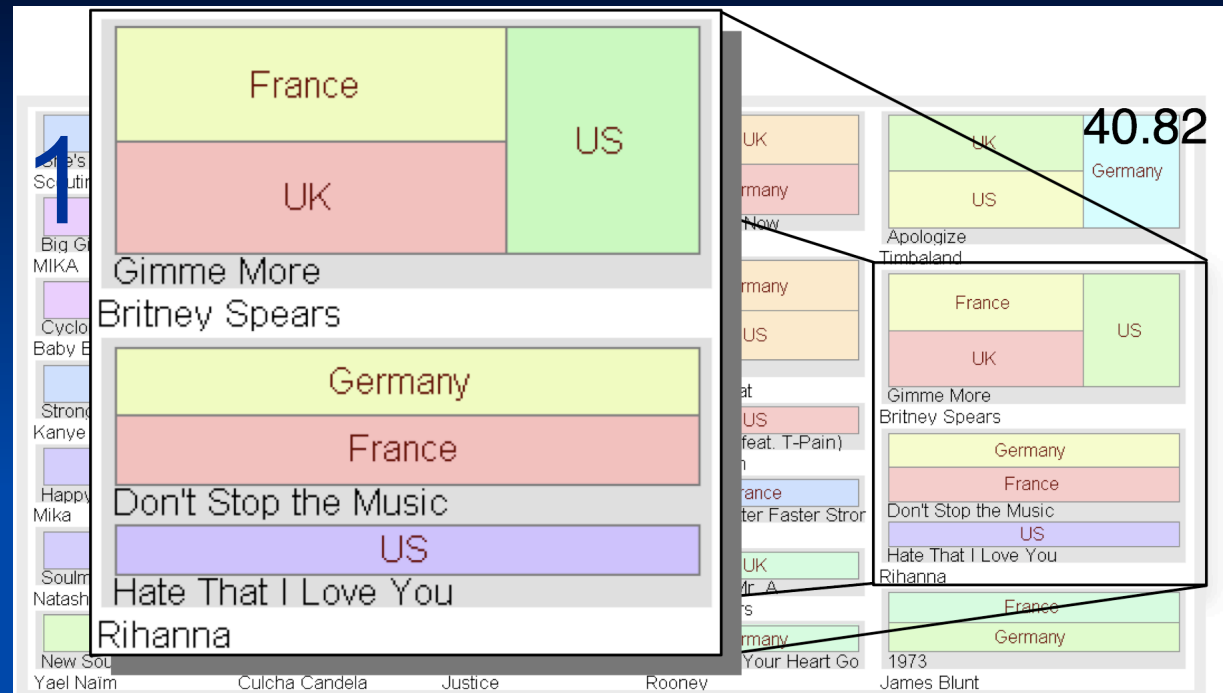

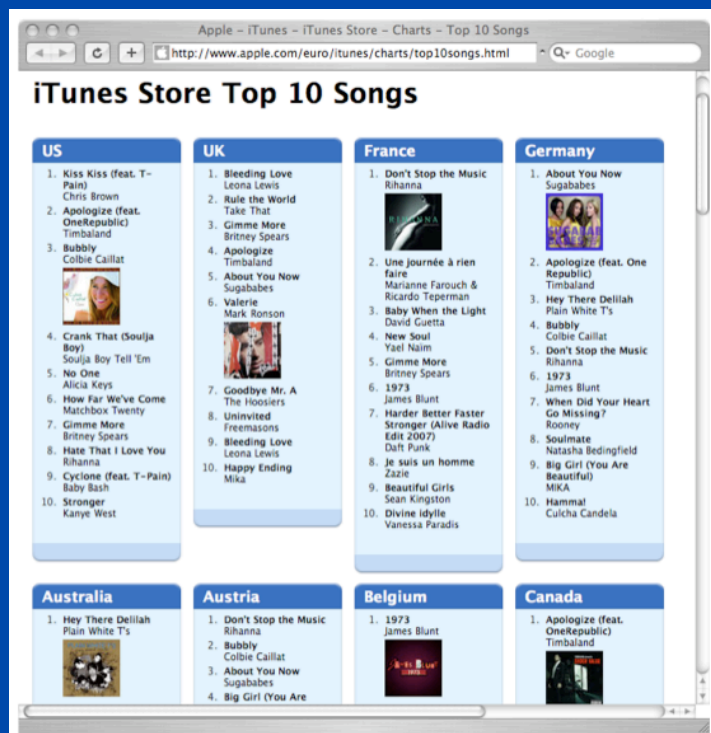

iTunes Country Chart to TreeMap

Source (iTunes)	Target (TreeMap)
Country	Colour
Artist Name	Level 0
Song Name	Level 1
Chart Position	Level 2

of mapping permutations: 24

of *visible* map'g permutations: 24

[illegible]

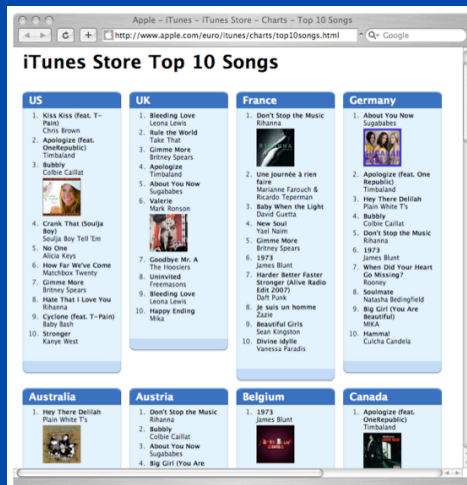

Target (Graph)

Node 0
Node 1
Level 2

of mapping permutations: 6

of *visible* map'g permutations: 6

32.14

Summary:

- Ontologies with Certainty Factors
- Ontology Mapping
- **Pragmatic Visualization Pipeline**
 - Domain Ontology (DO)
 - Visual Representation Ontology (VRO)
 - Semantic Bridge Ontology (SBO)
- **Scored (and ranked) visualizations**
 - Automatic Information Visualization for Non-Experts

Thank you
